<b>Update description:</b>	Review by Zerbetto Davide		

## 2 Document goal

This document explain how to use the SpagoBI Installer 1.9.2.

## 3 References

Some of the concepts of this document refer to the following documentation:

- SpagoBI business intelligence platform framework (available at <http://spagobi.eng.it/>)
- Exo Portal Platform (available at <http://www.exoplatform.com>)

## 4 System requirements

The system requirements for the SpagoBI installation are as follows:

- JDK version 1.5.x
- OpenOffice 2.0.x (for booklets creation): an environment variable named `OPENOFFICE_HOME` must point to OpenOffice installation directory or the `PATH` environment variable must contain the OpenOffice installation program folder.
- 512 MB memory (suggested).

## 5 Introduction to SpagoBI Platform 1.9.2 installation procedure

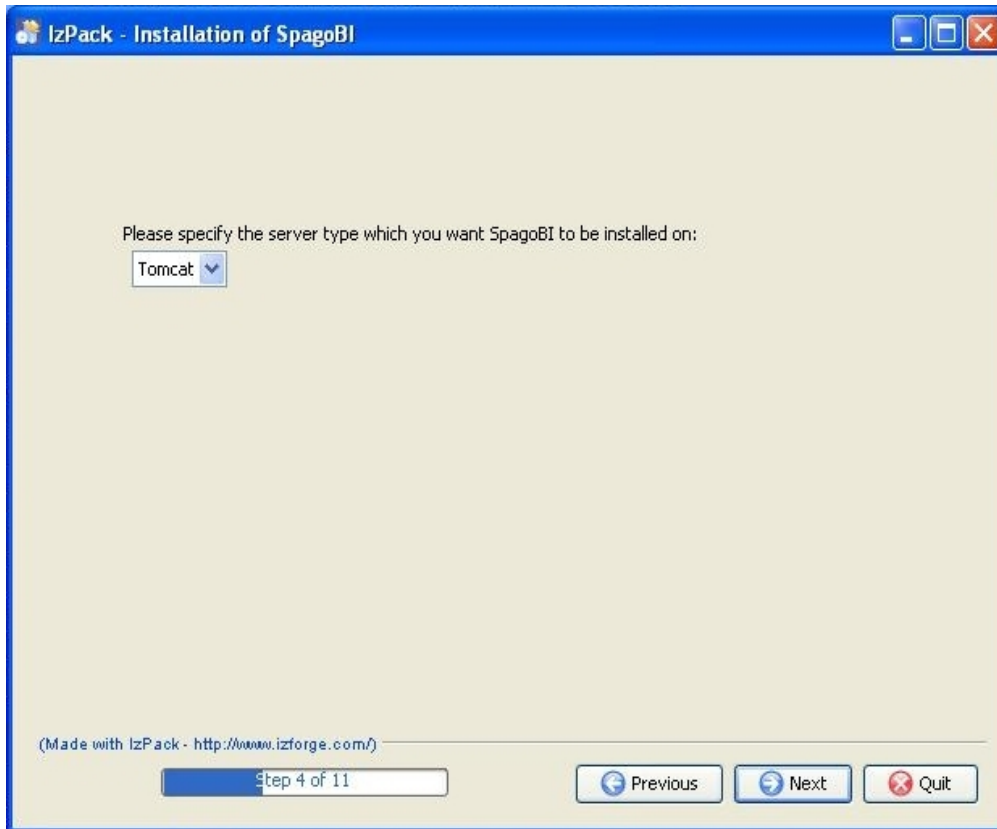

In order to install SpagoBI Platform you have to download the SpagoBIInstaller-1.9.2-xxx.zip file, then unzip it and launch the file

- StartSpagoBIIntaller.bat (Windows users)
- StartSpagoBIIntaller.sh (Unix/Linux users)

Then the installer starts and it will guide you during the SpagoBI Platform installation steps.

Here below we explain the meaning of some steps that you will encounter during the installation procedure.

## Server choice

SpagoBI Platform must be installed on an existing application server installed on your pc. This server can be Tomcat, JBoss or JOnAS (you can choose) and must have eXo-Portal Platform installed on it.

Possible server/eXo-Portal versions for SpagoBI Platform 1.9.2 are:

1. **Tomcat 5.0.28 with eXo-Portal 1.1.4**
2. **JBoss 4.0.3SP1 with eXo-Portal 1.1.2**
3. **JOnAS 4.7.4 with eXo-Portal 1.1.3**

If you don't have any of the above servers on your pc you have to proceed as follows:

1. **Tomcat 5.0.28 with eXo-Portal 1.1.4**  
download eXoPortal-tomcat-1.1.4.zip from:  
[http://forge.objectweb.org/project/download.php?group\\_id=151&file\\_id=7208](http://forge.objectweb.org/project/download.php?group_id=151&file_id=7208)  
unzip it into a local folder and the job is done.
2. **JBoss 4.0.3SP1 with eXo-Portal 1.1.2**  
download jboss-4.0.3SP1.zip from:  
[http://sourceforge.net/project/showfiles.php?group\\_id=22866&package\\_id=16942&release\\_id=365509](http://sourceforge.net/project/showfiles.php?group_id=22866&package_id=16942&release_id=365509)

The available packs are summarized here below:

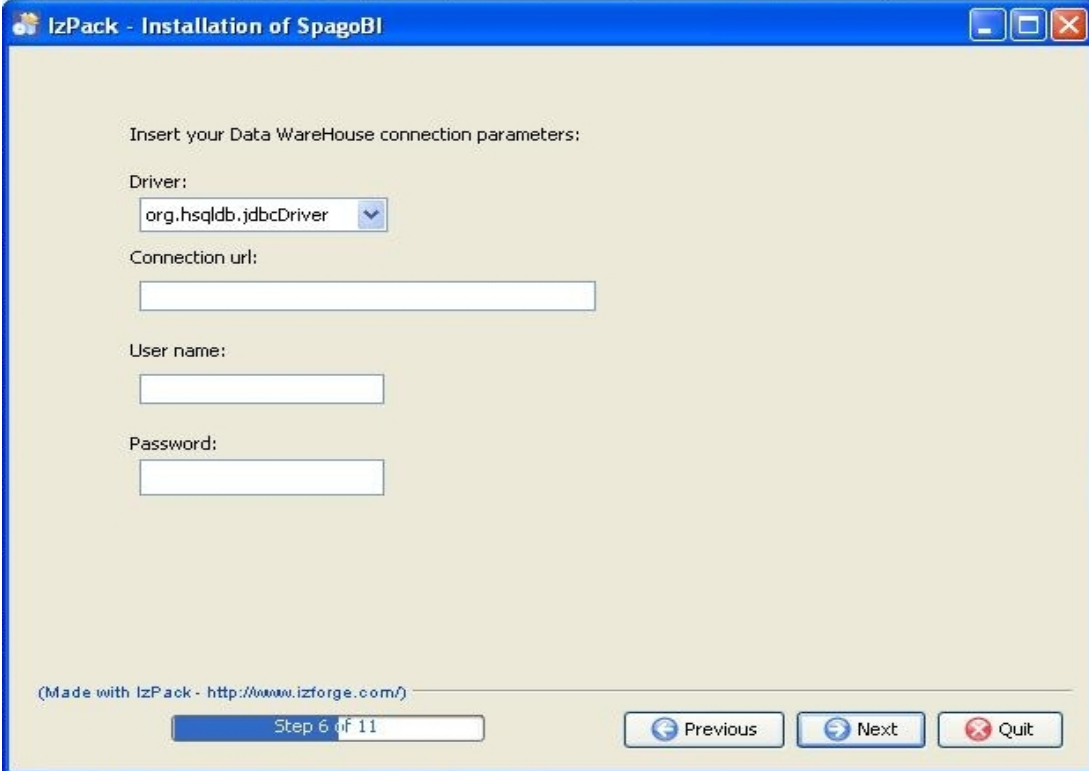

- installation files (libraries, configuration files, ...): this pack is mandatory;
- SpagoBI Core: it is mandatory;
- SpagoBI external engines: they are all optional;
- SpagoBI examples (the example documents of SpagoBI Demo and the example portal named 'sbiportal' with demonstrative groups and users configured): they are optional;
- documentation about SpagoBI: it is optional.

You can choose the SpagoBI external engines to be installed according to your requirements.

You can also choose to install or not the example documents of SpagoBI Demo.

**WARNING:** SpagoBI Demo examples contains documents for all SpagoBI supported engines. If you exclude some engines from the installation procedure, the relevant examples will not work!!

### Data warehouse configuration

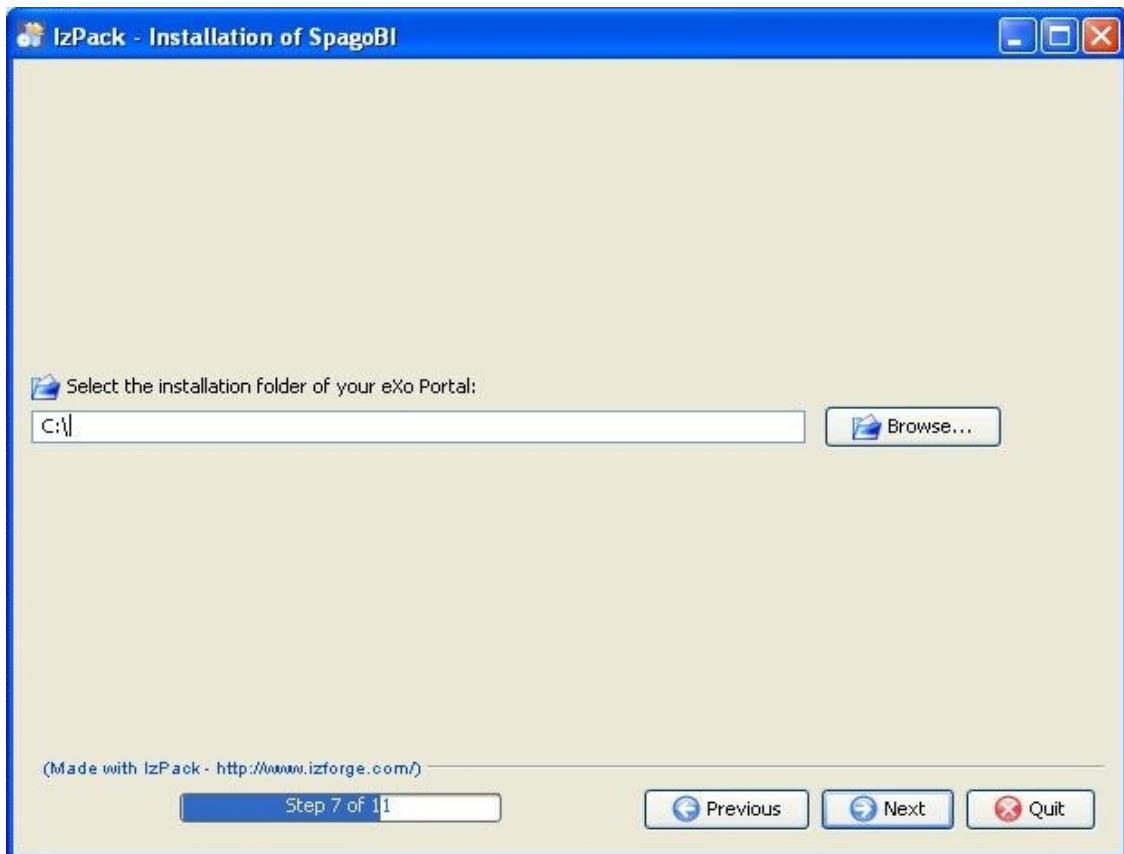

The screenshot shows a window titled "IzPack - Installation of SpagoBI". The main content area is titled "Insert your Data Warehouse connection parameters:". It contains four input fields: "Driver:" with a dropdown menu showing "org.hsqldb.jdbcDriver", "Connection url:" with an empty text box, "User name:" with an empty text box, and "Password:" with an empty text box. At the bottom, there is a progress bar showing "Step 6 of 11" and three buttons: "Previous", "Next", and "Quit". A small note at the bottom left says "(Made with IzPack - http://www.izforge.com/)".

Only if you decided not to install the SpagoBI Demo examples, the installer will ask you the connection parameters to your data warehouse (driver, connection url, username and password). The available database servers are Hsqldb, Oracle, Postgres or MySQL.

If you have decided to install the SpagoBI Demo examples, the installer will not ask you any connection parameters since the data warehouse is supposed to be an Hsql demonstrative db that will be automatically installed on your pc.

### Exo Portal path selection

You have to select the base folder where the server (hosting eXo portal) is installed. See previous “**Server Choice**” chapter.

## Local repository selection

The installer does not contain all the packs needed for the installation but it is able to automatically download them from the ObjectWeb repository (that's the remote repository). More precisely, SpagoBI core and external engines binary packs are not included; they will be downloaded into a local folder of your choice (that's local repository).

In order to avoid redundant and heavy downloads, the installer asks you if you have a local repository, since maybe you downloaded the packs manually before or you installed SpagoBI 1.9.2 using the same installer another time before: if it is the case, you have to select the folder where binary packs were downloaded. Instead, if it is the first time you use this installer, just select an empty folder: binary packs will be downloaded there and you will be able to use it as local repository during next installation procedures.

Then the installer will perform all the operation required.

### When the installation is completed

If you want to start working with SpagoBI Platform, take a look into SpagoBI Quick Start: you will see how to configure documents, parameters and so on.

If you want to change or to customize the installation, take a look to the SpagoBI documentation (How To and Installation Manual).
